

Author-izer

Mohamad Gholinia Kojidi

A web-based application that makes co-writing of fictional and non-fictional books possible.

In this application members can open a project or contribute to an already open one. Those who open a project are allowed to accept offered contributions or reject them and edit the entire text while contributors to a project can only revise their own part of the text and wait for it to be accepted. Each author adds a section to the text as a block or book-section when accepted by the main author. This helps different ideas regardless of physical distances get woven into a richer, more creative text, or a research can benefit from a larger group of scholars.

The texts then can be categorized as free books and those to be purchased as the author(s) decide. Readers can also evaluate the books and give stars as readers review. Authors receive points or stars so others may know the abilities of the contributor or the main author.

Since the purchase function needs paid APIs, the project might not focus on that function but leaves it as a possibility. Other functions or minor changes may add during the development
